                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a NADPH-dependent aldehyde reductase (AR2). The polynucleotide sequence was modified using using the method of the invention. The specification describes a method for designing a synthetic polynucleotide. The method comprises providing a starting polynucleotide, determining the predicted free energy of folding per base of the polynucleotide, modifying the polynucleotide by replacing a codon with a different codon to provide a modified polynucleotide, determining free energy of folding per base of the modified polynucleotide, determining comparing this with that of the original polynucleotide. The method is useful for developing nucleic acid sequences that enhance expression of the synthetic genes are used in application of gene shuffling, directed evolution and molecular breeding methods. The method allows expression of genes from various organisms such as mammals, plants, yeast, fungi and bacteria in prokaryotic hosts, such as Escherichia coli and eukaryotic hosts at commercially viable levels, in particular proteins with low yield such as methionine gamma-lyase from P. putida.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a modified NADPH-dependent aldehyde reductase (AR2). The polynucleotide sequence was modified using using the method of the invention. The specification describes a method for designing a synthetic polynucleotide. The method comprises providing a starting polynucleotide, determining the predicted free energy of folding per base of the polynucleotide, modifying the polynucleotide by replacing determining free energy of folding per base of the modified polynucleotide, and comparing this with that of the original polynucleotide. The method is useful for developing nucleic acid sequences that enhance expression of the encoded protein in a consecutive enhance expression of the synthetic genes are used in application of gene shuffling, directed evolution and molecular breeding methods. The method allows expression of genes from various organisms such as mammals, plants, yeast, fungi and bacteria in prokaryotic hosts, such as Escherichia coli and eukaryotic hosts at commercially viable levels, in particular proteins with low yield such as methonine gamma-lyase from P. putida

The present invention describes a polynucleotide (I) comprising a sequence of a Bifidobacterium genome selected from the nucleotide sequences given in ABQ81842 and ABQ81843, or a sequence exhibiting at least 90% identity or which hybridises with the sequences given in ABQ81843. Also described is a polynucleotide (II) encoding a fusion protein, comprising a sequence selected from 1097 sequences given in ABP65258 to ABP66354 ligated in frame to a polynucleotide encoding a heterologous polypeptide. (I) has antidiarrheic and antibacterial activities, and can be used as an inhibitor of Salmonella. (I) (which is a probe) is useful for the detection and/or identification of Bifidobacterium longum in a biological sample. A carrier containing the lactic acid bacterium Bifidobacterium longum NCC2705 (CNCM I-2618) can be used for preventing and/or treating diarrhoea brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition selected from tablets, liquid bacterial based products, milk based products, infant formula, pet food or a pharmaceutical composition selected from tablets, liquid bacterial suspensions, dried oral supplement, dry tube feeding or wet tube feeding. (I) is useful in DNA arrays or chips to carry out analysis of the expression of the Bifidobacterium gene. ABQ81844 to ABQ81850 represent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Ma

                                                                                                                                                                                                                                              A thermostable DNA ligase from a hyperthermophilic archaebacterium, e.g. P. furiosus, catalyses template-dependent ligation at temps. of 30-80 degrees C, and retains its catalytic ability when subjected to temps. of 85-100 degrees C. The ligase functions effectively in the ligase chain reaction without significant blunt-end ligation. (Updated on 25-MAR-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Listing from the present invention but not mentioned further within the specification. N.B. The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                        Thermostable DNA ligase from specificity and stability at in ligase chain reaction.

                                                                                                                                                                                                                                                                                                                                             WPI; 199
                                                                                                                                                                                                                                                     The present sequence is that of a purified thermostable DNA ligase isolated from a hyperthermophilic marine archaebacterium, Pyrococi furiosus (Pfu). The Pfu DNA ligase catalyses template dependent list temperatures of about 30-80 deg.C, and substantially retains it catalytic ability when subjected to temperatures of 85-100 deg.C. an estimated mol. wt. of 50-70 kDa.                                                                                                                                            the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that that an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) manufacturing an antibiotic; (10) profiling a compound that influences the activity of pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits proliferation of an organism activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the penetral proliferation to isolate candidate molecules for rational for cellular proliferation in cells other than S. aureus, S. typhimurium, required for proliferation in cells other than S. aureus, S. typhimurium, cellular prolaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained cellular prolaryotic essential genes. Note: The sequence data for this patent did not form part of the present sequence is encoded by one of the patent did not form part of the present sequences.

                                                                                                                                                                                                                                                                                                                                     CC The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, cliquin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert polypeptide that can be used in the recombinant DNA construct of the invention.
                                                                                                                                                                                                                         Query Match

The invention describes a recombinant DNA construct comprising a construct comprising a construct comprising a construct comprising a consilection are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for comproving plant tolerance to cold, heat, drought, herbicides, extreme comprision or plant cells by modification of the cell cycle pathway, for conferring confinence to plant disease, for producing galactomannan, construct is useful for increased resistance to plant disease, for producing galactomannan, confining or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert polypetide that can be used in the recombinant DNA construct of the

                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                        polynucleotides encoding them. The sequences are useful in diagnosis and the prophylaxis and treatment of pathological conditions, as molecular targets for diagnosis and cc prophylaxis and treatment of pathological conditions resulting from a cc bacterial infection, for evaluating a compound, such as a polypeptide, cfor the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant components for diagnosis and/or treatment of p. aeruginosa-derived peptides or polypeptides, as target infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-CABO84396 represent P. aeruginosa polypeptides of the invention. Note: The specification but was obtained in electronic format from USPTO at sequence.html

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression controlled and inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid comprising a promoter operably linked to the nucleic acid containing the vector; (3) an isolated containing the vector; (4) an isolated containing the vector; (6) antibited by the inding continuation or the formal through the proliferation of the sequence of the gene product or that has an activity against (6) inhibiting cellular proliferation; (8) containing the vector of an antibiody capable of specifically binding containing the vector of an antibiody capable of specifically binding containing an activity against a biological pathway of the gene product of the test compound that inhibits proliferation; (8) compound acts; (9) manufacturing an antibiotic; (10) profiling a compound acts; (12) manufacturing an antibiotic; (10) profiling a compound acts; (12) dentifying an antibiotic; (10) profiling a compound acts; (11) a culture compound that inhibits the gene product its overexpersed or underexpressed; (12) determining the extent convents of an organism. The antisense nucleic acids are useful for cellular proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation of solate candidate molecules for rational convents of properame, or for screening for homologous nucleic acids are useful for cequired for proliferation in cells other than S. aureus, S. typhimurium, ce patent did not form at directly from WIPO at the sequence data for this in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               21-MAR-2001;

                                                                                                                                                                                                                                                            The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal contivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food guplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Sequence 16593, Application US/09248796A; Patent No. 6747137; GENERAL INFORMATION:
APPLICANT: Keith Weinstock et al
TITLE OF INVENTION: NUCLEIC ACID AND AMING
TITLE OF INVENTION: FOR DIAGNOSTICS AND T
FILE REFERENCE: 107196.132;
CURRENT APPLICATION NUMBER: US/09/248,796A;
CURRENT FILING DATE: 1999-02-12;
PRIOR APPLICATION NUMBER: US 60/074,725;
PRIOR APPLICATION NUMBER: US 60/074,725;
PRIOR APPLICATION NUMBER: US 60/096,409;
PRIOR FILING DATE: 1998-08-13;
NUMBER OF SEQ ID NOS: 28208;
SEQ ID NO 16593;
LENGTH: 308
TYPE: PRT
ORGANISM: Candida albicans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AMINO ACID SEQUENCES RELATING TO FITTLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 17830
LENGTH: 802
                                                                                                                                                                                                                                                                                                                                                                                     RESULT 7
US-09-252-9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ; CLONE: pi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a NADPH-dependent aldehyde reductase (AR2). The polynucleotide sequence was modified using using the method of the invention. The specification describes a method for designing a continuous polynucleotide. The method comprises providing a starting polynucleotide, determining the predicted free energy of folding per base of the polynucleotide, modifying the polynucleotide by replacing a codon with a different codon to provide a modified polynucleotide, determining free energy of folding per base of the modified polynucleotide, determining comparing this with that of the original polynucleotide. The method is useful for developing nucleic acid sequences that enhance expression of the encoded protein in a heterologous host. The design and preparation of the synthetic genes are used in application of gene shuffling, directed evolution and molecular breeding methods. The method allows expression of genes from various organisms such as mammals, plants, yeast, fungi and bacteria in prokaryotic hosts, such as Escherichia coli and eukaryotic hosts at commercially viable levels, in particular proteins with low yield such as methionine gamma-lyase from P. putida.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                reductase (AR2). The polynucleotide sequence was modified using using the method of the invention. The specification describes a method for designing a synthetic polynucleotide. The method comprises providing a starting polynucleotide, determining the predicted free energy of folding the predicted free energy of folding the provide a modified by replacing a codon with a different codon to provide a modified by replacing determining free energy of folding per base of the modified polynucleotide, and comparing this with that of the modified colynucleotide. The method is useful for developing nucleic acid sequences that enhance expression of the encoded protein in a codynucleotide. The design and preparation of the synthetic genes are breeding methods. The method allows expression of genes from various organisms such as mammals, plants, yeast, fungi and bacteria in commercially viable levels, in particular proteins with low yield such as method in particular proteins with low yield such as method particular proteins with low yield such particular proteins with low yield such particu
